ILYA SHARAFEEV

Frontend Engineer — React / Next.js / TypeScript

ilyasharafeev01@gmail.com | +380 68 031 0159 | Telegram | LinkedIn | github.com/IlyaSharafeev

Nessebar, Bulgaria (EET) — **100% remote** | **Full-time**, 5/2, full overlap with the Ukrainian working day | English **B2**

SUMMARY

Frontend engineer with **4+ years of commercial experience** and **1.5+ years shipping production Next.js**. At my current company I joined as the founding frontend engineer and **built the platform's frontend from zero**: design tokens → shared component library → three applications in one monorepo. Before that I architected an SSR platform for an SEO-dependent product and cut initial load by 35%. I am comfortable **owning the whole frontend next to a backend lead** — from the first component to production, including SEO, Core Web Vitals, E2E coverage and a safe migration path for existing URLs. **AI-first is my daily workflow**, not a slogan: Claude Code and LLM agents handle scaffolding, refactors and test generation, while I own the architecture, the review and the final call.

TECHNICAL SKILLS

React & Next.js	**Next.js** (App Router, Server Components, SSR / SSG / ISR, Route Handlers, Metadata API, `next/image`, middleware & redirects), **React 16–18**, Hooks, Suspense; Vercel deployments
TypeScript	Expert level — generics, discriminated unions, utility & mapped types, typed API clients, strict mode; led a full JavaScript → TypeScript migration on a production codebase
Data & state	React Query / SWR (caching, invalidation, optimistic updates, loading / error / empty states), Zustand, Redux Toolkit; REST APIs by contract (OpenAPI, typed clients), GraphQL (Apollo), WebSockets
UI systems	Design tokens → component library → pages; Storybook, Tailwind CSS, Styled Components / CSS Modules, SCSS, Material UI; complex responsive layouts, pixel-accurate implementation from Figma, accessible semantic markup
SEO & performance	SSR / ISR, metadata & canonical, hreflang, sitemap and redirect maps for site migrations, Core Web Vitals, image optimisation (`next/image`, responsive srcset, lazy loading), code splitting, list virtualisation
Testing	Cypress (E2E for critical flows), Jest / Vitest, React Testing Library
AI-first workflow	Claude Code daily on real product work — agents for scaffolding, refactors, test generation and pre-review of my own diffs; custom skills and scripts for repetitive checks; strict verify-by-hand discipline for anything that ships
Workflow & infra	Git, GitHub PR flow, code review, GitHub Actions & GitLab CI, Docker, Vercel, AWS (S3, CloudFront, Lambda), Jira
Also	Vue 3 / Nuxt, Angular, Ionic & Capacitor

EXPERIENCE

Gelios — Frontend Engineer — Jan 2025 — Present · Remote

New EdTech platform built from zero on Next.js: student portal, teacher portal and an internal CRM.

- Joined as the **founding frontend engineer** and built the frontend from scratch on **Next.js (App Router) and TypeScript**: set up the Turborepo monorepo, design tokens, a shared component library in Storybook and a common data layer — **over 50% less duplicated code** across three apps and a much shorter path to launch for a two-person team.
- Built the data-heavy CRM — 1 000+ row lists with server-side filtering, sorting and pagination, bulk actions and multi-step forms — then fixed its performance with list virtualisation, React Query caching and debounced inputs: **UI CPU usage −60%**, no more freezes.
- Integrated REST and GraphQL APIs through typed clients with consistent loading / error / empty states and cache invalidation; added a WebSocket layer for real-time chat and notifications.
- Covered the critical user flows with **Cypress E2E tests**; every change goes through PR review and GitHub Actions CI.

Stack: Next.js (App Router), React, TypeScript, Turborepo, Zustand, React Query, GraphQL, REST, WebSockets, Storybook, Styled Components, Cypress, GitHub Actions

AUTODOC Group — **Frontend Developer (contract)**

Mar 2026 — Present · Remote

*Two SEO-critical storefronts of a German auto parts e-commerce group — **orap.de** and **handlerparts.com** — on Nuxt with SSR and multiple locales.*

- **URL migrations without losing traffic:** when a catalogue section was retired I **301'd its URLs** to the locale home instead of deleting them; the whole group tree is rendered as links **in the SSR HTML** so crawlers see the full structure without JS; sitemap paths moved into configuration.
- Led a **framework major upgrade on a live shop** (Nuxt 3 → 4): test coverage for the stores and tables first, then fixed an `unhead` mismatch that had silently dropped every meta tag, and added a regression test asserting that `useSeoMeta` actually reaches the document head.
- Own orap.de's frontend almost end to end — **243 of 256 commits, 228 components**: catalogue, product pages, cart, bulk article search, customer dashboard, PayPal checkout, German legal pages.
- Accessibility enforced in CI (`eslint-plugin-vuejs-accessibility`, **axe-core inside Playwright**); dependency audit down from 21 advisories to 3 accepted.

Stack: Nuxt 3 & 4, Vue 3, TypeScript, Pinia, Tailwind CSS, @nuxt/image, nuxt-schema-org, PayPal SDK, Playwright, axe-core, Vitest, msw

Auto parts e-commerce storefront — **Frontend Developer (contract)**

2026 · Remote

Complete storefront frontend for an automotive parts catalogue, implemented from Figma to a pixel-accurate spec.

- Implemented the catalogue end to end: category pages with **filters and sorting**, search results with empty states, product page with **gallery** and stock states, cart and a multi-step checkout — three breakpoints (1920 / 768 / 390) served by one set of components.
- Semantic, accessible markup to the client's spec (fieldset-based filters, native select sorting, list and link semantics in pagination, aria-labelled sections) and an automated geometry check against Figma coordinates with a 1 px tolerance.

Stack: Nuxt 3, Vue 3, TypeScript, SCSS, Puppeteer-based visual checks

Onix-Systems — **Frontend Engineer**

Dec 2022 — Dec 2024

Outsourcing: long-running client products on React / Next.js and Vue / Nuxt.

- Architected an **SSR platform from the ground up** for an SEO-dependent product (Nuxt): route- and component-level caching, optimised critical rendering path, aggressive code splitting — load time from ~5 s to sub-second, **−35% initial load**, Core Web Vitals up and search rankings with them.
- Led a phased **Vue 2 → Vue 3 migration** (−40% legacy code, +25% team velocity) and a full **JavaScript → TypeScript migration** (−30% runtime errors) — both on live products, without a feature freeze.
- Built product configuration and checkout flows on React / Next.js and Vue: dynamic option sets, dependent fields, backend-driven validation, generated PDF documents.
- Delivered a cross-platform mobile app (Ionic + Capacitor) by reusing the existing component library — iOS and Android from one codebase, ~400 developer hours saved.

Stack: React, Next.js, Redux, TypeScript, Vue 3, Nuxt.js, Pinia, React Query, Tailwind CSS, Quasar, Ionic, Capacitor, Jest

Egolist — **Frontend Developer**

Dec 2021 — Nov 2022

High-traffic marketplace — listings, filters, seller dashboard, messaging.

- Developed listing and filtering pages, item cards and the seller dashboard on a Vue 2 + Vuex codebase, from written requirements and designs.
- Designed a low-latency **WebSocket layer handling 10 000+ concurrent connections** for chat and notifications.
- Built the GitLab CI/CD pipeline (tests, build, deploy) that turned manual releases into one-click ones.

Stack: Vue 2, Vuex, TypeScript, SCSS, WebSockets, REST, Jest, Cypress, GitLab CI

EDUCATION

2024 — 2025 **M.Sc. in Computer Science** — Oles Honchar Dnipro National University, Dnipro, Ukraine

LANGUAGES

English — **B2** (technical documentation, written communication, async work with international teams) | Ukrainian — native | Russian — fluent
